Slide 3/8

PCA-based Face Recognition

• ? (Turk & Pentland 1991)

Representation of faces using PCA directly on image intensities

One of most famous uses of PCA in

computer vision

Seminal reference for face recognition (but would work better if we modeled shape

variation rather than lightness variation)

Eigenface Recognition

Slide 4/8

Eigenfaces

1. Given set of K registered face images

 $(R \times C)$ with varying capture conditions

- 2. Represent as $R \times C$ long vectors
- 3. Do ? (special trick for large matrices)

Eigenface Recognition

• Key principle:

Turn image array into long vector Represent sample image (face) as weighted sum of eigenimages (eigenfaces)

O2014, School of Informatics, University of Edinburgh

Slide 5/8

Given unknown face image F_u

- 1. Subtract mean face and project onto $? \longrightarrow \vec{w_u}$
- 2. Given database of projections $\{\vec{w}_i\}_{i=1}^K$, find class c with smallest Mahalanobis distance d_c to \vec{w}_u
- 3. If d_c small enough, return c as identity

Mean face and subset of principle component axes/images [Morris '04] 4. Represent person i by projection weights $\vec{w_i}$ ©2014, School of Informatics, University of Edinburgh Eigenface Recognition Slide 7/8 **Eigenface Results** $2500\ 128 \times 128$ image database, varied lighting

- 96% successful recognition over ? variations
- \bullet 85% over orientation variations
- $\bullet~64\%$ over size variations
