Boundary Finding
Slide 3/11

## Boundary Finding

1) Get points that lie on boundary:

$$
[r, c]=\operatorname{find}(\text { bwperim(Image,4) }==1 \text { ) }
$$

2) Remove any spurs on boundary, track and segment

$$
\begin{aligned}
{[\mathrm{sr}, \mathrm{sc}] } & =\text { removespurs }(\mathrm{r}, \mathrm{c}, \mathrm{H}, \mathrm{~W}) ; \\
{[\mathrm{tr}, \mathrm{tc}] } & =\text { boundarytrack }(\mathrm{sr}, \mathrm{sc}) ; \\
{[\mathrm{cr}, \mathrm{cc}] } & =\text { findcorners }(\mathrm{tr}, \mathrm{tc}) ;
\end{aligned}
$$

## Data Description

Goal: describe parts in same vocabulary of boundary shapes as model

Assume a binary image of the part
Need to find pixels that lie on the boundary

Boundary Finding

## Removing Dangling Spurs

Spur: any boundary pixel with only 1 neighbor inside a $3 \times 3$ neighborhood

```
changed=1;
while changed==1
```

```
changed = 0;
```

changed = 0;
[sr,sc] = find(work==1); % work: boundary pixels
[sr,sc] = find(work==1); % work: boundary pixels
for i = 1 : length(sr) % check each boundary point
for i = 1 : length(sr) % check each boundary point
neigh = work(sr(i)-1:sr(i)+1,sc(i)-1:sc(i)+1);
neigh = work(sr(i)-1:sr(i)+1,sc(i)-1:sc(i)+1);
count=sum(sum(neigh));
count=sum(sum(neigh));
if count < 3 % only point and at most
if count < 3 % only point and at most
work(sr(i),sc(i)) = 0; % 1 neighbor so remove it
work(sr(i),sc(i)) = 0; % 1 neighbor so remove it
changed=1;

```
            changed=1;
```

Trailing ends omitted.

## Boundary Cleaning Results

Raw boundary:

## Removing Unnecessary Boundary Pixels

Find unnecessary corners:

*     - boundary point to keep
c - boundary point to remove
? - boundary point thru here somehow
shaded box - interior or exterior pixel
thick red box - pixel neighbourhood inspected

Boundary Finding
Slide 8/11

## Getting a Consecutive Boundary Track

TRACK TO FIRST
UNTRACKED BOUNDARY PIXEL ENCOUNTERED AS i GOES $1 . . .7$

NEXT DIRECTIONS

| 1 | 2 | 3 |
| :---: | :---: | :---: |
| 8 | x | 4 |
| 7 | 6 | 5 |

$$
\begin{aligned}
& \text { LAST MOVE }=3 \\
& \text { NEXT MOVE }=8,1,2,3,4,5,6
\end{aligned}
$$

$\mathrm{NEXT}=(\mathrm{LAST}+3+\mathrm{i}) \mathrm{MOD} 8+1$

Boundary Finding

## What Have We Learned?

Introduction to

- Getting a boundary from a binary image
- Cleaning that boundary up using morpholgical operations
- Making a consecutive list of points
