3D Line Calculation

Aim: recovery of 3D line positions

Assume: line successfully matched in L & R images

1. Compute 3D plane that goes through image line and camera origin
2. Compute of 3D planes from 2 cameras (which gives a line)

3D plane passing thru 2D image line

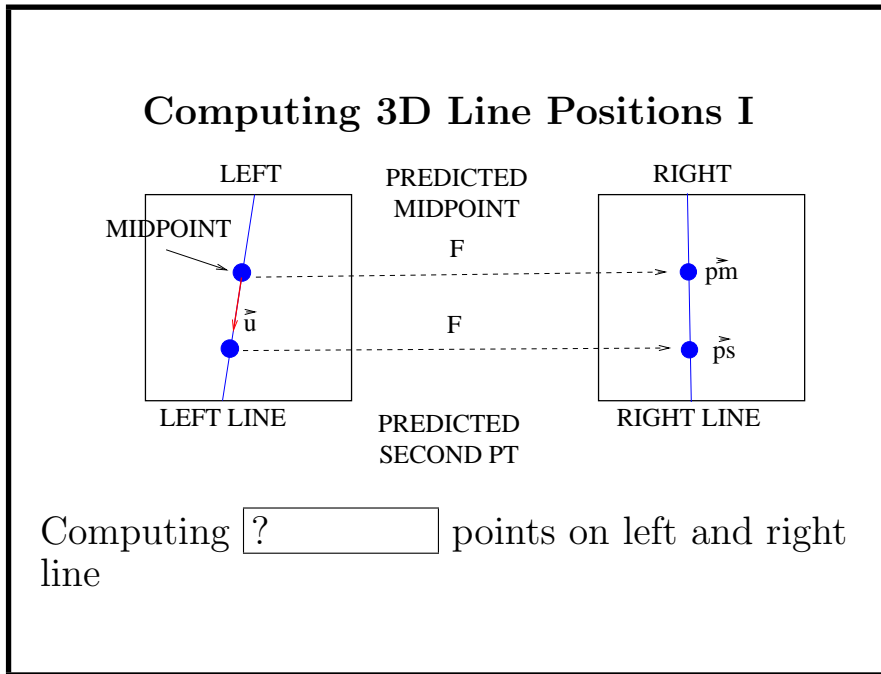

2D image line $l = [a, b, c]'$ is $a * col + b * row + c = 0$

Then is l/P

Compute for left and right images

3D Plane Intersection →

Computing 3D Line Positions II

Given: paired lines (l,r) with midpoints $\vec{m}_l = (m_{lx}, m_{ly})$ and \vec{m}_r and directions $\vec{a}_l = (a_{lx}, a_{ly})$ and $\vec{a}_r = (a_{rx}, a_{ry})$

Fundamental matrix \mathbf{F} that maps left to right image

- 1) Define [?] left midpoint: $\vec{c}_l = (m_{lx}, m_{ly}, 1)'$ and line direction $\vec{u} = (a_{lx}, a_{ly}, 0)'$
- 2) Define projective right line: $\vec{v} = (a_{ry}, -a_{rx}, -(a_{ry}, -a_{rx}) \cdot \vec{m}_r)$
- 3) Define skew matrix version of projective right line (for algebraic line intersection):

$$\mathbf{M} = \begin{bmatrix} 0 & -v_z & v_y \\ v_z & 0 & -v_x \\ -v_y & v_x & 0 \end{bmatrix}$$

Computing 3D Line Positions III

- 4) Predict left midpoint position in right image on paired line (so that exact triangulation works):

$$\vec{p} = \mathbf{M} * \mathbf{F} \vec{c}_l, \vec{p} \vec{m}_r = (p_x/p_z, p_y/p_z)'$$

- 5) Predict second left point on line in right image:

$$\vec{q} = \mathbf{M} * \mathbf{F} (\vec{c}_l + 10 * \vec{u}), \vec{p} \vec{s}_r = (q_x/q_z, q_y/q_z)'$$

- 6) [?] pairs $(\vec{c}_l, \vec{p} \vec{m}_r)$ and $(\vec{c}_l + 10 * \vec{u}, \vec{p} \vec{s}_r)$ to get 3D points \vec{g} and \vec{h}

- 7) Compute matched line 3D midpoint $\vec{p}_3 = \vec{g}$ and 3D line direction $\vec{d}_3 = (\vec{h} - \vec{g}) / \|\vec{h} - \vec{g}\|$

Triangulating 2 points $(\vec{a}, \vec{b}) \rightarrow \vec{x}$

Given: Left/right projection matrices: $\mathbf{P}_l, \mathbf{P}_r$

Left/right [?] parameter matrices: $\mathbf{K}_l, \mathbf{K}_r$

Left/right matched points: $\vec{a} = (a_x, a_y)'$ and $\vec{b} = (b_x, b_y)'$

Compute:

$$\vec{r} = (\mathbf{K}_l)^{-1} (a_x, a_y, 1)'$$
 and $\vec{s} = (\mathbf{K}_r)^{-1} (b_x, b_y, 1)'$

$$\vec{a}_1 = r_1 * \mathbf{P}_l(3, :) - \mathbf{P}_l(1, :)$$
 and $\vec{a}_2 = r_2 * \mathbf{P}_l(3, :) - \mathbf{P}_l(2, :)$

$$\vec{a}_3 = s_1 * \mathbf{P}_r(3, :) - \mathbf{P}_r(1, :)$$
 and $\vec{a}_4 = s_2 * \mathbf{P}_r(3, :) - \mathbf{P}_r(2, :)$

$$[USV] = svd\left(\frac{\vec{a}_1}{\|\vec{a}_1\|}; \frac{\vec{a}_2}{\|\vec{a}_2\|}; \frac{\vec{a}_3}{\|\vec{a}_3\|}; \frac{\vec{a}_4}{\|\vec{a}_4\|}\right)$$

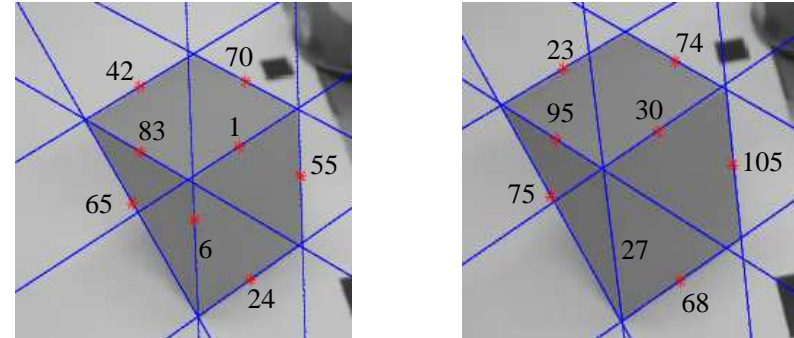

$$\vec{x} = V(1 : 3, 4)' / V(4, 4)$$

Found Valid Line Pairs

All lines present and all but one still misplaced

Block 1 2D Line

Clearly reasonably in 3D

What We Have

- Computing 3D line by intersecting backprojected 2D lines
- Backprojection geometric calculations, including triangulation
- Backprojection is reasonably accurate, but not perfect
