Flat Part Recognition

How to recognise these and similar parts

Object Recognition General

Overview

Several approaches to classification/recognition. Choose the same class as objects with:

- **Shape** - similar shape descriptors
- **Appearance** - similar pixel values
- **Geometric** - similar structures in similar places with similar parameters
- **Graph** - similar part relationships
- **Bag of Words** - enough similar local feature descriptors

Slide 3/7

Recognition Assumptions (Here)

- Flat, viewed orthographically
- Always from same distance
- Good contrast everywhere
- No specularities
- Here: shape-based recognition

Slide 4/7

Slide credit: Bob Fisher

Top level Matlab

```
Dim = 3;           % number of feature properties
modelfile = input('Model file name\n?','s');
eval(['load ',modelfile,' NumCls Means ICor'])
run=1;
while ~(run == 0)
    currentimagergb = liveimagejpg
    currentimage = rgb2gray(currentimagergb);
    vec = extractprops(currentimage);
    class = classify(vec,NumCls,Means,ICor,Dim)
    run = input('Do another image (0,1)\n?');
end
```

Shape-based recognition algorithm

1. Extract object from image (aka segmentation)
2. Compute properties
3. Use properties to compute class
4. Learning model properties for the classes
