Aspects of Network Traffic

Uli Harder*

June 10, 2003

Abstract

This talk will present an overview of the research undertaken during the QUAINT (QUantitative Analysis of the INTernet) project. This will include a review of what one can measure (and does measure). A brief summary of the large number of possible models trying to explain the nature of network traffic will be given. In particular the talk will focus on the measurements performed during QUAINT and the model that is being developed.
