# Modelling biological features

SPA designed for modelling computing systems do not readily capture some of the features of biological systems.

Particular problems are encountered with:

- stoichiometry the multiplicity in which an entity participates in a reaction;
- general kinetic laws while mass action is widely used other kinetics are also commonly employed.

Conclusions

# Modelling biological features

SPA designed for modelling computing systems do not readily capture some of the features of biological systems.

Particular problems are encountered with:

- stoichiometry the multiplicity in which an entity participates in a reaction;
- general kinetic laws while mass action is widely used other kinetics are also commonly employed.
- multiway reactions although thermodynamics arguments can be made that there are never more than two reagents involved in a reaction, in practice it is often useful to model at a more abstract level.

Examples

Conclusions

### Illustration

Consider a conversion of a substrate S, with stoichiometry 2, to a product P which is under the influence of an enzyme E, i.e.

$$2S \xrightarrow{E} P$$

Examples

Conclusions

## Illustration

Consider a conversion of a substrate S, with stoichiometry 2, to a product P which is under the influence of an enzyme E, i.e.

$$2S \xrightarrow{E} P$$

In process algebras such as the stochastic  $\pi$ -calculus this must be broken up into a sequence of unary and binary reactions, e.g.:

 $S + S \longrightarrow 2S$   $2S + E \longrightarrow 2S:E$   $2S:E \longrightarrow P:E$   $P:E \longrightarrow P+E$

Examples

Conclusions

## **Motivation**

Bio-PEPA has been designed to overcome these challenges:

- Unique rates are associated with each reaction (action) type, separately from the specification of the logical behaviour. These rates may be specified by functions.
- The representation of an action within a component (species) records the stoichiometry of that entity with respect to that reaction. The role of the entity is also distinguished.

Examples

## **Motivation**

Bio-PEPA has been designed to overcome these challenges:

- Unique rates are associated with each reaction (action) type, separately from the specification of the logical behaviour. These rates may be specified by functions.
- The representation of an action within a component (species) records the stoichiometry of that entity with respect to that reaction. The role of the entity is also distinguished.
- Multi-way reactions are possible in Bio-PEPA since it has CSP-style synchronisation rather than CCS-style synchronisation. Thus a multi-way reaction is abstracted as a multi-syncronisation.

Examples

Conclusions

## Reagent-centric view [CGH04]

► Bio-PEPA refers to the reagent-centric view modelling style.

Conclusions

# Reagent-centric view [CGH04]

- ► Bio-PEPA refers to the reagent-centric view modelling style.
- Models are based on discrete levels of concentration within a species.
- The granularity of the system is defined in terms of the step size h of the concentration intervals.
- We define the same step size h for all the species, with few exceptions. This follows from the law of conservation of mass.

Examples

Conclusions

# Reagent-centric view [CGH04]

- ► Bio-PEPA refers to the reagent-centric view modelling style.
- Models are based on discrete levels of concentration within a species.
- The granularity of the system is defined in terms of the step size h of the concentration intervals.
- We define the same step size h for all the species, with few exceptions. This follows from the law of conservation of mass.
- If *l<sub>i</sub>* is the concentration level for the species *i*, the concentration is taken to be *x<sub>i</sub>* = *l<sub>i</sub>* × *h*.

Examples

Conclusions

# Reagent-centric modelling (2)

Role	Impact on reaction rate	Impact on reagent
Reactant	positive impact, e.g. proportional to	decreases level
	current concentration	
Product	no impact, except at saturation	increases level
Enzyme	positive impact, e.g. proportional to current concentration	level unchanged
Inhibitor	negative impact, e.g. inversely pro- portional to current concentration	level unchanged

Examples

Conclusions

#### Reagent-centric view (3)

The rate of a transition is consistent with the granularity.

Hillston and Ciocchetta. LFCS, University of Edinburgh.

Calculi for Biological Systems, Part 2

<ロト 4 回 ト 4 三 ト 4 三 ・ つへで</p>

Examples

Conclusions

## Reagent-centric view (3)

- The rate of a transition is consistent with the granularity.
- In a Bio-PEPA model the granularity must be specified by the modeller as the expected range of concentration values and the number of levels considered.

Hillston and Ciocchetta. LFCS, University of Edinburgh.

Calculi for Biological Systems, Part 2

# Reagent-centric view (3)

- The rate of a transition is consistent with the granularity.
- In a Bio-PEPA model the granularity must be specified by the modeller as the expected range of concentration values and the number of levels considered.
- The form of the CTMC derived from Bio-PEPA, which we term the CTMC with levels, will depend on the granularity of the model.

Hillston and Ciocchetta. LFCS, University of Edinburgh.

Calculi for Biological Systems, Part 2

▲□▶▲□▶▲三▶▲三▶ ④�?

Examples

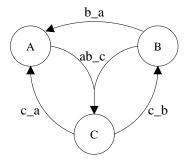

Conclusions

# Reagent-centric view (3)

- The rate of a transition is consistent with the granularity.
- In a Bio-PEPA model the granularity must be specified by the modeller as the expected range of concentration values and the number of levels considered.
- ► The form of the CTMC derived from Bio-PEPA, which we term the CTMC with levels, will depend on the granularity of the model.
- As the granularity tends to zero the behaviour of this CTMC with levels tends to the behaviour of the ODEs [CDHC08].

Conclusions

## Bio-PEPA reagent-centric example

- $A \stackrel{\text{def}}{=} (ab_{-}c, 1) \downarrow A + (b_{-}a, 1) \uparrow A + (c_{-}a, 1) \uparrow A$
- $B \stackrel{\text{def}}{=} (ab\_c, 1) \downarrow B + (b\_a, 1) \downarrow B$  $+ (c\_b, 1) \uparrow B$

$$C \stackrel{\text{def}}{=} (c\_a, 1) \downarrow C + (c\_b, 1) \downarrow C + (ab\_c, 1) \uparrow C$$

$$\left(A(I_{A0}) \underset{{}_{ab\_c,b\_a}}{\bowtie} B(I_{B0})\right) \underset{{}_{ab\_c,c\_a,c\_b}}{\bowtie} C(I_{C0})$$

Examples

Conclusions

#### State representation

The state of the system at any time consists of the local states of each of its sequential/species components.

Hillston and Ciocchetta. LFCS, University of Edinburgh.

Calculi for Biological Systems, Part 2

▲□▶▲□▶▲□▶▲□▶ ▲□ ● ● ●

Examples

Conclusions

#### State representation

- The state of the system at any time consists of the local states of each of its sequential/species components.
- The local states of components are quantitative rather than functional, i.e. distinct states of the species are represented as distinct components, not derivatives of a single component.

Hillston and Ciocchetta. LFCS, University of Edinburgh.

Calculi for Biological Systems, Part 2

▲□▶ ▲□▶ ▲三▶ ▲三▶ ▲□ ▶ ④�?

Examples

Conclusions

## State representation

- The state of the system at any time consists of the local states of each of its sequential/species components.
- The local states of components are quantitative rather than functional, i.e. distinct states of the species are represented as distinct components, not derivatives of a single component.
- A component varying its state corresponds to it varying its concentration level.

## State representation

- The state of the system at any time consists of the local states of each of its sequential/species components.
- The local states of components are quantitative rather than functional, i.e. distinct states of the species are represented as distinct components, not derivatives of a single component.
- A component varying its state corresponds to it varying its concentration level.
- This is captured by an integer parameter associated with the species and the effect of a reaction is to vary that parameter by a number of levels corresponding to the stoichiometry of this species in the reaction.

## The Bio-PEPA system

A Bio-PEPA system  $\mathcal{P}$  is a 6-tuple  $\langle \mathcal{V}, \mathcal{N}, \mathcal{K}, \mathcal{F}_{\mathsf{R}}, Comp, \mathsf{P} \rangle$ , where:

- V is the set of compartments;
- N is the set of quantities describing each species (step size, number of levels, location, ...);
- $\mathcal{K}$  is the set of parameter definitions;
- $\mathcal{F}_R$  is the set of functional rate definitions;
- Comp is the set of definitions of sequential components;
- P is the model component describing the system.

### Goldbeter's model

## Analysis: ODEs

The stoichiometry matrix D:

			R2						
-	С	+1	0	0	0	0	0	-1	x <sub>C</sub>
	М'	0	0	-1	+1	0	0	0	X <sub>M'</sub>
	Μ	0	0	+1	-1	0	0	0	XM
	Χ'	0	0	0	0	-1	+1	0	x <sub>X'</sub>
	Х	0	0 0 0 0 0	0	0	+1	-1	0	X <sub>X</sub>

The vector that contains the kinetic laws is:

$$w = \left(v_i \times 1, k_d \times x_C, \frac{V_{M1} \times x_C}{K_c + x_C}, \frac{x_{M'}}{(K_1 + x_{M'})}, \frac{V_2 \times x_M}{(K_2 + x_M)}, \frac{V_{M3} \times x_M \times x_{X'}}{(K_3 + x_{X'})}, \frac{V_4 \times x_X}{(K_4 + x_X)}, \frac{v_d \times x_C \times x_X}{(K_d + x_C)}\right)$$

Examples

Conclusions

### Goldbeter's model

## Analysis: ODEs (2)

The system of ODEs is obtained as  $\frac{d\bar{x}}{dt} = D \times w$ , where  $\bar{x}^T =: (x_C, x_{M'}, x_M, x_{X'}, x_X)$  is the vector of the species variables:

$$\begin{aligned} \frac{dx_C}{dt} &= v_i \times 1 - k_d \times x_C - \frac{v_d \times x_C \times x_X}{(K_d + x_C)} \\ \frac{dx_{M'}}{dt} &= -\frac{V_{M1} \times x_C}{K_c + x_C} \frac{x_{M'}}{(K_1 + x_{M'})} + \frac{V_2 \times x_M}{(K_2 + x_M)} \\ \frac{dx_M}{dt} &= +\frac{V_{M1} \times x_C}{K_c + x_C} \frac{x_{M'}}{(K_1 + x_{M'})} - \frac{V_2 \times x_M}{(K_2 + x_M)} \\ \frac{dx_{X'}}{dt} &= -\frac{V_{M3} \times x_M \times x_{X'}}{(K_3 + x_{X'})} + \frac{V_4 \times x_X}{(K_4 + x_X)} \\ \frac{dx_X}{dt} &= \frac{V_{M3} \times x_M \times x_{X'}}{(K_3 + x_{X'})} - \frac{V_4 \times x_X}{(K_4 + x_X)} \end{aligned}$$

Conclusions

## Conclusion: SPA for Systems Biology

Whilst the notation can be a challenge, the compositionality and precise interpretation of process algebras make them attractive for modelling biological signalling pathways.

Choices in the design of the SPA such as the form of synchronisation which is incorporated has a strong influence on the way in which systems can be modelled.

Conclusions

## Conclusion: SPA for Systems Biology

Whilst the notation can be a challenge, the compositionality and precise interpretation of process algebras make them attractive for modelling biological signalling pathways.

Choices in the design of the SPA such as the form of synchronisation which is incorporated has a strong influence on the way in which systems can be modelled.

The inclusion of stochastic information about the duration of actions/reactions creates a very natural mapping from SPA models to stochastic simulations at the molecular models.

Conclusions

## Conclusion: SPA for Systems Biology

Whilst the notation can be a challenge, the compositionality and precise interpretation of process algebras make them attractive for modelling biological signalling pathways.

Choices in the design of the SPA such as the form of synchronisation which is incorporated has a strong influence on the way in which systems can be modelled.

The inclusion of stochastic information about the duration of actions/reactions creates a very natural mapping from SPA models to stochastic simulations at the molecular models.

However, such molecular mappings typically generate state spaces which are too large for other SPA analysis techniques.

Conclusions

#### Conclusions: Bio-PEPA

Bio-PEPA is a modification of the process algebra PEPA for the *modelling* and *analysis* of biochemical networks.

## Conclusions: Abstract Modelling

Abstract modelling offers a compromise between the individual-based and population-based views of systems which biologists commonly take.

Moveover we can undertake additional analysis based on the discretised population view.

The abstract Markovian models allow quantities of interest such as "response times" to be expressed as probability distributions rather than single estimates. This may allow better reflection of wet lab data which also shows variability.

Examples

Conclusions

## **Future directions**

There are number of areas for on-going and future work. For example:

- ► The definition of bisimulations and equivalences.
- The extent to which the process algebra compositional structure can be exploited during model analysis, particularly in conjunction with model checking techniques.
- The issue of coping with unknown and uncertain values in experimental data.
- …and many more…
