Biological advances mean that much more is now known about the components of cells and the interactions between them.

Modelling Biochemical Signalling Pathways with Stochastic Process Algebra 🔹 ロト 🖅 ト イヨト イヨト イヨー

- Biological advances mean that much more is now known about the components of cells and the interactions between them.
- Systems biology aims to develop a better understanding of the processes involved.

- Biological advances mean that much more is now known about the components of cells and the interactions between them.
- Systems biology aims to develop a better understanding of the processes involved.
- It involves taking a systems theoretic view of biological processes — analysing inputs and outputs and the relationships between them.

- Biological advances mean that much more is now known about the components of cells and the interactions between them.
- Systems biology aims to develop a better understanding of the processes involved.
- It involves taking a systems theoretic view of biological processes — analysing inputs and outputs and the relationships between them.
- A radical shift from earlier reductionist approaches, systems biology aims to provide a conceptual basis and a methodology for reasoning about biological phenomena.

Jane Hillston. LFCS, University of Edinburgh.

000000	

#### Motivation

## Systems Analysis

- In biochemical signalling pathways the events of interests are
  - when reagent concentrations start to increase;
  - when concentrations pass certain thresholds;
  - when a peak of concentration is reached.

lenges

- For example, delay from the activation of a gene promoter until reaching an effective level to control the next promoter in a pathway depends on the rate of protein accumulation.
- These are the data that can be collected from wet lab experiments.

Introduction	to Systems	Biology
000000		

#### Motivation

## Systems Analysis

- In biochemical signalling pathways the events of interests are
  - when reagent concentrations start to increase;
  - when concentrations pass certain thresholds;
  - when a peak of concentration is reached.
- For example, delay from the activation of a gene promoter until reaching an effective level to control the next promoter in a pathway depends on the rate of protein accumulation.
- These are the data that can be collected from wet lab experiments.
- The accumulation of protein is a stochastic process affected by several factors in the cell (temperature, pH, etc.).

Introduction	to	Systems	Biology	
000000				

#### Motivation

# Systems Analysis

- In biochemical signalling pathways the events of interests are
  - when reagent concentrations start to increase;
  - when concentrations pass certain thresholds;
  - when a peak of concentration is reached.
- For example, delay from the activation of a gene promoter until reaching an effective level to control the next promoter in a pathway depends on the rate of protein accumulation.
- These are the data that can be collected from wet lab experiments.
- The accumulation of protein is a stochastic process affected by several factors in the cell (temperature, pH, etc.).
- Thus it is more realistic to talk about a distribution rather than a deterministic time.

Stochastic Process Algebra for Biology

Conclusions

# Individual vs. Population behaviour

 Biochemistry is concerned with the reactions between individual molecules and so it is often more natural to model at this level.

Jane Hillston. LFCS, University of Edinburgh.

Modelling Biochemical Signalling Pathways with Stochastic Process Algebra 🔹 ロト 🖅 ト イヨト イヨト イヨー

# Individual vs. Population behaviour

- Biochemistry is concerned with the reactions between individual molecules and so it is often more natural to model at this level.
- Experimental data is usually more readily available in terms of populations cf. average reaction rates vs. the forces at play on an individual molecule in a particular physical context.

Jane Hillston. LFCS, University of Edinburgh.

# Individual vs. Population behaviour

- Biochemistry is concerned with the reactions between individual molecules and so it is often more natural to model at this level.
- Experimental data is usually more readily available in terms of populations cf. average reaction rates vs. the forces at play on an individual molecule in a particular physical context.
- These two views should be regarded as alternatives, each being appropriate for some models. The challenge then becomes when to use which approach.

# Individual vs. Population behaviour

- Biochemistry is concerned with the reactions between individual molecules and so it is often more natural to model at this level.
- Experimental data is usually more readily available in terms of populations cf. average reaction rates vs. the forces at play on an individual molecule in a particular physical context.
- These two views should be regarded as alternatives, each being appropriate for some models. The challenge then becomes when to use which approach.
- Note that given a large enough number of molecules, an "individuals" model will (in many circumstances) be indistinguishable from the a "population" level model.

 With perfect knowledge the behaviour of a biochemical reaction would be deterministic.

Jane Hillston. LFCS, University of Edinburgh.

- With perfect knowledge the behaviour of a biochemical reaction would be deterministic.
- However, in general, we do not have the requisite knowledge of thermodynamic forces, exact relative positions, temperature, velocity etc.

Jane Hillston. LFCS, University of Edinburgh.

- With perfect knowledge the behaviour of a biochemical reaction would be deterministic.
- However, in general, we do not have the requisite knowledge of thermodynamic forces, exact relative positions, temperature, velocity etc.
- Thus a reaction appears to display stochastic behaviour.

- With perfect knowledge the behaviour of a biochemical reaction would be deterministic.
- However, in general, we do not have the requisite knowledge of thermodynamic forces, exact relative positions, temperature, velocity etc.
- ► Thus a reaction appears to display stochastic behaviour.
- When a large number of such reactions occur, the randomness of the individual reactions can cancel each other out and the apparent behaviour exhibits less variability.

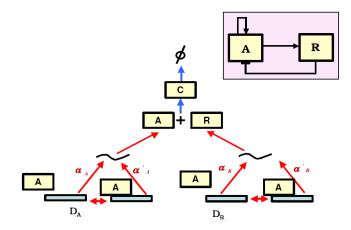

- With perfect knowledge the behaviour of a biochemical reaction would be deterministic.
- However, in general, we do not have the requisite knowledge of thermodynamic forces, exact relative positions, temperature, velocity etc.
- ► Thus a reaction appears to display stochastic behaviour.
- When a large number of such reactions occur, the randomness of the individual reactions can cancel each other out and the apparent behaviour exhibits less variability.
- However, in some systems the variability in the stochastic behaviour plays a crucial role in the dynamics of the system.

# Modularity vs. Infinite Regress

As computer scientists we are firm believers in modularity and compositionality. When it comes to biochemical pathways opinion amongst biologists is divided about whether is makes sense to take a modular view of cellular pathways.

Some biologists (e.g. Leibler) argue that there is modularity, naturally occuring, where they define a module relative to a biological function.

Jane Hillston. LFCS, University of Edinburgh.

# Modularity vs. Infinite Regress

As computer scientists we are firm believers in modularity and compositionality. When it comes to biochemical pathways opinion amongst biologists is divided about whether is makes sense to take a modular view of cellular pathways.

Some biologists (e.g. Leibler) argue that there is modularity, naturally occuring, where they define a module relative to a biological function.

Others such as Cornish-Bowden are much more skeptical and cite the problem of infinite regress as being insurmountable.

Jane Hillston. LFCS, University of Edinburgh.

There is a fundamental challenge when modelling cellular pathways that little is known about some aspects of cellular processes.

Jane Hillston. LFCS, University of Edinburgh.

There is a fundamental challenge when modelling cellular pathways that little is known about some aspects of cellular processes.

In some cases this is because no experimental data is available, or that the experimental data that is available is inconsistent.

Jane Hillston. LFCS, University of Edinburgh.

There is a fundamental challenge when modelling cellular pathways that little is known about some aspects of cellular processes.

In some cases this is because no experimental data is available, or that the experimental data that is available is inconsistent.

In other cases the data is unknowable because experimental techniques do not yet exist to collect the data, or those that do involve modification to the system.

There is a fundamental challenge when modelling cellular pathways that little is known about some aspects of cellular processes.

In some cases this is because no experimental data is available, or that the experimental data that is available is inconsistent.

In other cases the data is unknowable because experimental techniques do not yet exist to collect the data, or those that do involve modification to the system.

Even when data exists the quality is often poor.

Abstraction, Modularity and Reasoning

## Reagent-centric modelling

Reagent role	Impact on reagent	Impact on reaction rate
Producer	decreases concentration	has a positive impact,
		i.e. proportional to cur-
		rent concentration
Product	increases concentration	has no impact on the
		rate, except at saturation
Enzyme	concentration unchanged	has a positive impact,
		i.e. proportional to cur-
		rent concentration
Inhibitor	concentration unchanged	has a negative impact,
		i.e. inversely proportional
		to current concentration

#### Case Study

### Commentary on the model

- I have shown the model with only high and low levels of concentration. In general we would discretise the concentration more coarsely with say 6 or 7 levels. As we add levels we are capturing the concentration at finer levels of granularity.
- The two levels (high/low) are sufficient to generate the ODEs or stochastic simulation.
- For this model stochastic simulation and ODE analysis coincide.

### Commentary on the model

- I have shown the model with only high and low levels of concentration. In general we would discretise the concentration more coarsely with say 6 or 7 levels. As we add levels we are capturing the concentration at finer levels of granularity.
- The two levels (high/low) are sufficient to generate the ODEs or stochastic simulation.
- For this model stochastic simulation and ODE analysis coincide.
- We also considered an alternative model of the pathway with subpathways as components, and we were able to use the process algebra equivalence to show that our two models have the same behaviour.

Stochastic Process Algebra for Biology

#### Case Study

## Reasoning and Model Checking

The original published model of the Ras/Raf-1/MEK/ERK pathway had a structure which allowed MEK to grow unboudedly which had not been detected in the ODE model.

Model checking using the PRISM probabilistic model checker allowed us to check properties such as whether one protein will exhibit a peak of concentration before another.

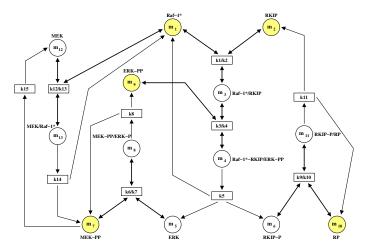

To do this we considered models with 6 levels of concentration, i.e. the range of possible values of concentration are split into 6 discrete levels — this shows good agreement with the ODE solution for transient behaviour.

Jane Hillston. LFCS, University of Edinburgh.

Numerical analysis of the CTMC can yield detailed information about the dynamic behaviour of the model.

Jane Hillston. LFCS, University of Edinburgh.

Numerical analysis of the CTMC can yield detailed information about the dynamic behaviour of the model.

A steady state analysis provides statistics for average behaviour over a long run of the system, when the bias introduced by the initial state has been lost.

Numerical analysis of the CTMC can yield detailed information about the dynamic behaviour of the model.

A steady state analysis provides statistics for average behaviour over a long run of the system, when the bias introduced by the initial state has been lost.

A transient analysis provides statistics relating to the evolution of the model over a fixed period. This will be dependent on the starting state.

Numerical analysis of the CTMC can yield detailed information about the dynamic behaviour of the model.

A steady state analysis provides statistics for average behaviour over a long run of the system, when the bias introduced by the initial state has been lost.

A transient analysis provides statistics relating to the evolution of the model over a fixed period. This will be dependent on the starting state.

Note, however, that a transient Markovian analysis is exact because it takes account of all possible evolutions, unlike a stochastic simulation which considers only one possible evolution in each run.
